

## **Who'll pay most for the clean energy revolution?**

The clean, distributed energy revolution is here. And it will be driven by a vast scale-up of energy storage and distributed solar. We need to vastly decarbonize electricity and transportation to slow global warming and its damage to our economies, health and standards of living. The good news is several technologies – cost-competitive, job-creating and economy-boosting technologies – are now widely commercially available. And in many US states, the “distributed energy resources” (DERs) experience is proving that private-sector developers, customers and investors are willing to share the costs – if customers are allowed to take greater control over their energy choices.
